Super App Race

Cryptocurrency as
a Potential Hook Product

September 2022

01

Introduction

Super App is a single application that enables a consumer to access multiple products in an integrated fashion, providing greater value than the consumer would achieve by going to individual apps for each product instead¹.

The trend of Super App is originated in China as WeChat Pay and Alipay – the mobile payment apps for Tencent and Alibaba respectively – started integrating payment (in store and online), daily life services (food order, ride hailing, ticket booking etc.) and wealth management (investment, insurance, credit access, etc.) into a single and easy-to-use interface which satisfies most of the daily transaction needs for consumers and enable them to go cardless.

Following the lead of WeChat Pay and Alipay, the emergence of Super Apps is seen everywhere around the world. In Europe, fintech giants such as Revolut, Klarna and Lydia have made substantial progress in gaining prime position in the competitive landscape. For example, starting with flagship travel bank card

with zero-fee international money transfer service, Revolut has gradually announced several initiatives which demonstrate its ambitious on “building the first truly global Super App”. In 2021, Revolut partnered with Chubb in a move that diversifies its insurance offers. It also launched Stays, a feature which allows users to book hotels directly in the app, and On-Demand Pay, a feature which enables employees to advance their accrued salaries.

Similar to Revolut, players starting from different original offers simultaneously end up with the combination of savings, money transfer, credit lending, insurance and some other key financial services needed by mainstream consumers. The value propositions could be achieved via multiple methods, but an initial “hook” product which could attract a large customer base who are willing to engage is a must-have for the winner. Except for that, a payment infrastructure is also a key as it’s the fundamental function to connect all the services.

VALUE PROPOSITIONS

- Superior overall user experience, customer-centric, sticky
- Compelling single view of multiple products, consolidated data to multiply value back to consumers
- Unique loyalty offers / rewards to incentivize the consumer to consolidate their products in the app
- Offer product discounts to confirm to consumers that they are getting the best deal

COMPETITIVE ADVANTAGES

- Stickiness / lock-in
- Hyper-personalization
- Superior value
- Lower price points
- Easier cross-selling (~zero marginal CAC)

**LARGE AND ENGAGED CUSTOMER BASE + INITIAL “HOOK” PRODUCT
+ PAYMENT IS THE LIFE-BLOOD**

02

Business Models

The business model of Super Apps is built on a philosophy that separate functions and features in the financial services market need to be turned into a connected ecosystem where the platform would streamline and control all data and information. Therefore, the company could prospect every incremental product sold to an existing customer coming with almost zero customer acquisition costs, making cross-selling highly profitable.

Currently, business models of large Super App racers could be mainly categorized into three types: Winner-Take-All, Over the Top and Hybrid².

WINNER-TAKE-ALL OWN APPS	AGGREGATION – OVER THE TOP 3RD PARTY APPS	AGGREGATION – HYBRID OWN + 3RD PARTY APPS
<ul style="list-style-type: none"> • Build devoted customer base with banking or other consumer financial services • Expand to add more products, aiming to become their users' primary financial relationship 	<ul style="list-style-type: none"> • Create digital experience layers / marketplaces to connect users to existing ecosystem of digital banking and financial services • Largely a tech-only approach 	<ul style="list-style-type: none"> • Start with large customer base for existing product (financial or non-financial) • Connect customers to third-party offerings as well as developing in-house products
		

Source: FT Partners

ADVANTAGES

- High retention and life time value for existing users
- Robust data access, comprehensive overview of customer behavior, more accurate cross sell and upsell focus

CHALLENGES

- Have to persuade retail consumers to switch their primary financial services to the Super App
- Need to build financial products in house, which costs high

ADVANTAGES

- Aggregation players have a customer acquisition advantage as the users may come for a variety of financial or non-financial products
- Easier to scale up with the plug-play 3rd party partners
- Not directly compete with traditional banks

CHALLENGES

- Need a strong "hook" product to build meaningful customer base
- Over-the-top players can face resistance from legacy providers that do not want to participate in their ecosystem
- Hybrid players can lead to inherent conflict between being a discovery platform and prioritizing owned products

03

Positions of Traditional Banks

Super Apps offer the simple user interface with comprehensive financial/non-financial services. For traditional banks, it means that more and more users may bypass banking apps and simply use the more integrated Super Apps. The digital payment features would also potentially demotivate consumers to use cash and credit cards in daily expenditures.

Some banks have already become part of the Super App ecosystem by providing embedded “Banking-as-a-Service” to the apps, extending their reach through partnerships and collaborations with Fintechs to remain relevant and competitive. As the financial regulations could be very rigorous especially when it comes to internationalization, many Super App players prone to collaborate with traditional financial institutions to provide financial products such as loans, insurances and so on. This creates revenue-generating opportunities for banks. Some of them offer white-label services in the background and some go further to leverage their brands, using the platform to create a smoother and more convenient user experience. However, since the number of Super Apps is limited, banks will need to act quickly or risk having no one left to partner with³.

To better secure the market share and competitive advantages, banks can also consider adjusting their vision to embrace direct competition with Challengers and build Super Apps by their own. An Aggregation-Hybrid approach could be an appropriate choice for incumbents, which means they not only offer their products on other marketplaces but also offer third party products to their clients. This approach could enable banks to improve their data management and analytics capabilities and share it across various service areas and lines of business to develop a better view of the target audience. Furthermore, Super Apps will allow banks to shift their focus from simply conducting transactions towards building more long-term relationships that will lead to higher rates of customer acquisition, satisfaction and subsequently, stronger brand loyalty.

What Could be a “Hook” Product?

In order to attract affluent users while leveraging existing customer base, banks need to identify a strong hook product before launching their Super Apps.

Recent research published by MindFintech studying 15 traditional banks, 7 online banks and 20 neobanks, identified 28 functionalities present in mobile applications of traditional and challenger banks active in France in 2021. The following graph shows which features are found most frequently, and which have seen the most growth in adoption in mobile apps over the last year from 2020 to 2021.

As shown in the graph, the traditional features such as payment, transfers, automatic categorization of expenses are offered by most of the banks. Although these offers are regarded as essentials and prerequisites for a Super App that wants to scale up, it could be out of choices for a hook product since it brings limited differentiations. However, the most innovant and trendy offers being added such as BNPL (Buy now pay later) and Cryptocurrencies could be a good start. As there is an increasing trend with limited competitions in the market, the bank who is the pioneer and willing to take the initiative would gain the prime and grasp the opportunity to fly.

Cryptocurrency as a Hook Product

With a record market capitalization of \$3 trillion in 2021⁴, the crypto market is becoming a significant investment sector which could not be evited by any players who want to explore the market potentials and take the lead position in the future.

Top banks/neobanks/insurance/asset management companies have explored direct engagement such as setting up crypto trading desks or indirect engagement such as investment in startups. But there are a variety of differences between traditional incumbents and challengers/tech giants as the former is focusing on institutions or selected high-net-worth clients and invest heavily on the infrastructure, while the latter has already rolled out to retail customers.

To compete with challengers, banks must stay innovative and open to the affluent users. The one who is acting quickly would gain more retail customers before the market is getting crowded.

Crypto market is immense and there are different actors and layers inside the ecosystem. When it comes to retail users, the pain points usually launch with the knowledge barrier. Except for the frequent traders who are active on exchanges, many individuals don't have adequate knowledge on cryptocurrencies. They have huge interests on following the trend, but they might find it difficult and hassle to create their wallets, or when they want to make investments, there is a lack of reachable professional advice.

The aim of creating a Super App with crypto as a hook product is to allow the mass market to engage in the digital asset world even with limited knowledge and budget. Among the diverse offerings, we have identified 4 type of services which we think would be attractive to retail users from all backgrounds.

1. Trading

Directly purchase and sell cryptos inside the Super App with fiat currency in the account.

2. Payment

Settle daily expenditures with cryptos. Banks could build partnerships with merchants who are willing to accept cryptos. The merchants can price their goods in either fiat currency or cryptos, and the customers pay only with cryptos. If the selected payment currency is different from the pricing currency, a conversion will be done automatically on the customers' end. The conversion rate will be based on the market rate at payment time. When customers make payment, they can choose either via the app or via a crypto credit card issued by the bank.

3. Investment advisory & asset management

instead of investing in individual coins, customers could invest in pre-set portfolios based their risk appetite. The portfolio could also be adjusted according to customers' requirements.

4. Staking

allows customers to hold funds in a crypto pool and earn a percentage of rewards.

Banks' existing large client base would benefit the customer acquisition for these 4 features. And the latter could also bring synergies to the core banking products.

CURRENT ACCOUNT	LOANS	INVESTMENT	PAYMENT
Data monetization: all the transactions would pass by the current account, and the data generated would be useful for the decision making and assessment of individual clients' investment behavior	No direct synergies. The price volatility of cryptos bring risks to the investors and large potential downturn impact on the financier if investors take credits.	Enrich the offerings of banks; create upsell opportunities for other products such as insurance.	Crypto payment feature would bring flows, and the associated data information could help banks better analyze users' behavior and make more accurate proposals for upsells such as loans.

	ARPU ⁵	GROSS MARGIN %	USER BASE POTENTIAL%
Trading	€72 - 120	Low	80%
Payment	€6 - 12	Medium	40%
Investment Advisory & Asset Management	€180 - 200	High	50%
Staking	€50 - 62	High	30%

BANK CUSTOMER RETENTION	
Trading	Crypto trading features would help banks increase retention rate since the clients would benefit from the convenience of direct purchase of cryptos via daily used current accounts without the complication of transferring and funding a sperate account.
Payment	Increase customer retention. For SME clients (offline merchants & e-commerce): lower fees compare to debit/credit cards; For retail clients: international cross-border free.
Investment Advisory & Asset Management	Clients who choose to invest in portfolio instead of individual coins generally will switch platforms less frequently, which would increase the customer retention rate for banks.
Staking	Staking normally requires a vesting period, which discourage clients to switch platform frequently.

5 - Calculations refer to market average pricing and business models of leading companies such as Crypto.com, Revolut, Coinhouse, eToro, etc.

06

Execution Challenges

TECHNOLOGY ⁶

KYC, KYT & KYD

Verification has long been an issue for cryptocurrencies because of the standard way that banks establish trustworthiness. When they bring a new client onboard, they rely on KYC (Know Your Customer) verification. But KYC is a check only on the customers and not on the transaction, so it may not detect all cases of counterfeiting and money laundering. Therefore, KYT (Know Your Transaction) is critical to add complementarily, which is enabled by blockchain technology and can be used to easily track almost all transactions back to their sources. In addition, the KYT process can include analytics that recognize patterns of behaviors associated in the past with criminal activity and set off alarm bells when those patterns occur. Moreover, banks could also conduct KYD (Know Your Data) to further analyze the sources of transaction records and to validate data from cryptocurrencies where some transactions are not automatically traced. For KYC + KYT + KYD approach to work, banks need to raise their internal capabilities.

From the technical side, it requires functions include connectivity and analytics which could realize the ongoing vast data collection and analysis. And it also requires banks to fit the new technology into established system without compromising it.

CUSTODY

Neobanks and small exchanges use 3rd party custodian for the storage and protection. For larger institutions like banks, the counterparty and / or balance sheet risk of a third-party custodian might be too great. They may also have investment strategies that may be ineffective if combined with third party custody. Therefore, the self-custody sophistication is significant for banks. In addition, in order to launch more demanding services and products, custody as a foundational layer is playing a more and more important role. Top digital asset players have greatly invested in startups which provide technologies enabling clients to build their self-custody infrastructure. For example, BNY Mellon and SVB invested in Fireblocks, Paypal acquired Curv and Galaxy Digital acquired BitGo in 2021.

REGULATIONS⁷

Regulations on cryptocurrencies are getting more stringent on the global level. In EU, cryptocurrencies are currently covered under 5AMLD and local rules of each specific countries.

FRANCE

The French PACTE law was introduced in 2019, regulating the crypto sector by four basic principles: a) Legal status. Crypto firms are legally defined as digital asset service providers, or DASPs (PSAN in French); b) AML/CFT obligations. The AML/CFT obligations mandated by French regulators are based on the principles of the EU's Fifth AML Directive, which France implemented in January 2020; c) Mandatory registration. Any crypto firm operating in France or working with French clients must register with the Financial Markets Authority; d) Optional licenses. For additional administrative and marketing opportunities, French crypto firms can apply for non-mandatory licenses from the AMF. Prior to June 2021, these only affected crypto-to-fiat services and crypto custodian providers. In June 2021, France enacted new crypto regulations (Ordinance 2020-1544), that impact not only French companies, but also international crypto firms seeking to operate in France. As the latest regulations now come into effect, crypto-to-crypto exchanges and trading platforms are subject to the same AML/KYC obligations and mandatory registration as other crypto firms. In addition, KYC regulations have tightened in the French crypto sector in general. However, the latest rules now permit the use of third parties for fulfilling KYC obligations.

GERMANY

Germany was one of the first countries to provide legal certainty to financial institutions, allowing them to hold crypto-assets. Regulations stipulate that citizens and legal entities can buy or trade crypto assets if it is done through licensed exchanges and custodians. Firms must be licensed with the German Federal Financial Supervisory Authority⁵⁴ (BaFin). BaFin views and classifies cryptos as "units of account" within the meaning of the German Banking Act. They are therefore not legal tender, money, or foreign exchange notes or coins. The regulators have agreed, however, that they are deemed "crypto-assets" in accordance with the definition of financial instruments.

SPAIN

Despite having no formal legal status, virtual currencies in Spain are taxable as income and under VAT. In 2021 the Spanish regulator issued a joint statement warning of the risks and volatility associated with cryptos. The joint statement also highlighted that, from a legal standpoint, cryptocurrencies are not a means of payment and are not backed by a central bank or other customer protection mechanisms or authority. Spain issued Royal Decree Law 5/202176 which included a provision to regulate advertising related to cryptocurrencies.

MICA

In June 2022, the European Commission hammered out a new law known as Markets in Crypto-Assets (MiCA). This new regulation attempts to create a comprehensive regulatory framework for digital assets throughout the European Union. It will cover issuers of unbacked crypto-assets, and so-called "stablecoins", as well as the trading venues and the wallets where crypto assets are held. Under the provisional agreement achieved, crypto-asset service providers (CASPs) will need an authorization in order to operate within the EU, and they will have to respect strong requirements to protect consumer wallets and become liable in case they lose investors' crypto-assets. The rules are expected to come into force as early as 2024.

Overall, to launch the crypto products, banks will have to face increasing regulatory risks and the tightened policies would also have certain impacts on compliance costs.
